ABSTRACT/RESUME

Heterogeneous acid catalysts are of importance in the fine chemicals area, and several been investigated in reactions such as the Knoevenagel reaction, an important reaction with pronounced solvent dependency. The condensation of active methylene compounds with gem-diacetates in the presence of acid aluminosilicates (montmorillonite KSF, K10/ZnCl₂) without solvent and under microwave irradiation, an efficient of synthesis of arylidene compounds without isolation of aldehydes compounds. Cleavage of arylidene rhodanine derivative in position 5 in basic medium on Potassium Fluoride–Barium Oxide (BaO-KF) under focused microwave irradiation and free solvent is a simple and effective method for synthesis of, β-aryl-α-thiolacrylic acids.

I. Introduction

Alkylidene and arylidene are found in many natural products and have an interesting antibiotics properties, the most famous is albonoursin[1,2], isolated from fungal cultures. Besides their therapeutic properties (antiviral [3, 4], antifungal [3], antitumor[3], sedative[5], anesthetic[5], hypnotic [3], analgesic[5]), its arylidine’s derivatives [6,7] are an important intermediates synthetic of the heterocyclic compounds[8] and the most convenient source of β-aryl α-thioacrylic acids [9]. We reported herein that the condensation of active methylene compounds with benzylidene-1,1- diacetates (acylals) catalysed by clay Montmorillonite without solvent takes place rapidly under focused microwave irradiation. The use of heterogeneous acid catalysts allows a simplification of the purification step to a simple filtration separating the catalyst from the reaction media.

II. Experimental

Melting points (m.p) were determined with a Kofler hot apparatus and are uncorrected. Proton NMR spectra (PMR) were determined on Brucker AC 250 (250 MHz, CDCl3, Me4Si).Th.; TLC Analyses were performed by using Kieselgel Schleicher and Shull F 1500 Ls 254 and Merck 60F 254. The grinding of products were carried out on a analytical grinder A 10 of Janke and Kenkel-IKA Labortechnik. The Montmorillonite KSF and K10 was obtained from the firm of Süd Chemie, Degusa). The IR spectra were recorded as KBr pellets on JASCO FT/IR-4100 spectrometer UV-visible spectra (λmax log(ε)) were obtained with Spectrophotometer of UV-Force of T60U. Microwave irradiation were carried out with a commercial microwave oven (Whirlpool WMC10007AW) at 2450 MHz. and with resonance
cavity TEol13, joined to a generator MES 73-800 of microwaves. MES 73-800 of microwaves.

a) Preparation of Montmorillonite K10 Exchanged by Mn+

Procedure: In a 250 ml flask, the Montmorillonite K10 (20 g) was added to a solution of metallic salt ZnCl₂ (0.2 mol) dissolved in 100 ml of distilled water. The reaction mixture was stirred for 24 h at room temperature. The suspension was washed twice with distilled water then centrifuged. The Montmorillonite exchanged by ZnCl₂. Was washed with methanol and re-centrifuged. The solid was dried for 24 h in vacuum then finely ground. The final product was a clear beige color.

b) Preparation of the 1, 1 diacetoxy-1-(3, 4-methylenedioxyphenyl)methane (1)

Procedure: to a solution aromatic aldehyde (piperonal) (5 mmol) and freshly distilled acetic anhydride (5 mmol), montmorillonite KSF (3 g) was added at room temperature. The reaction mixture was magnetically stirred for 10 min. The resulting mixture was filtered. The filter cake was washed with CH₂Cl₂ (10 ml). The organic phase was dried over MgSO₄, filtered and the solvent was evaporated to give the pure desired compound as a white crystalline compound.

Yellow Solid crystallised in ethanol; m. p = 75 °C; C₁₀H₁₆O₆; MM = 274. 22 g/mol; Yield : 59 %; IR (KBr) cm⁻¹: 2916 (γ C-H), 1748 (γ C=O), 1588 (γ C=C); ¹H NMR (CDCl₃) δ: 1. 62 (m, 6H, 2 CH₂); 7. 47 (d, 1H, Hα); 7. 36  (m, 2H Hα); 7. 62 (m, 1H Hα); 7. 85 (m, 4H, H2,3,4,5 ar); 7. 99 (m, 2H, H2-ar); 8. 52 (s, 1H, CH); MS, m/z (%): 276 (M⁺ 100); 279 (19. 07); 280 (2. 8).

5-(Benzo-1, 3-dioxol-5-yl)methylene)-2, 2-dimethyl-1, 3-dioxane-4, 6-dione: (1b)

Prepared from diacetoxy-1-(3, 4-methylenedioxyphenyl)methane (5 mmol: 1. 26 g) and Meldrum Acid, (5 mmol: 0. 72 g) in presence of KSF; Microwaves (P= 520 W, t = 02 min); Red Solid crystallised in ethanol; m. p = 78 °C; C₁₀H₁₂O₅; MM = 232. 18 g. mol⁻¹; Yield : 61 %; IR (KBr) cm⁻¹ : 3060 (γ C-H), 2897 (γ CH₃), 1680 (γ C=O), 1660 (γ C=C), 1230 (γ C-O-C); ¹H NMR (CDCl₃) δ: 2. 07 (s, 6H, CH₃); 6. 96 (s, 2H, OCH₂O); 7. 45 (d, 2H ); 8. 03 (s, 1H, CH=); MS, m/z (%): 252 (M⁺ 100).

Knoevenagel Condensation with gem diacetates in presence of solid acid

General procedure: The 1. 1 diacetoxy-1-(3, 4-methylenedioxyphenyl)methane (5 mmol) and the activated methylene compound (5 mmol) are mixed in the presence of montmorillonite KSF (5g) hydrated with a grinder for 2 minutes. The reaction mixture was placed in a 50 ml Erlenmeyer flask and then activated by irradiation with microwaves. After cooling of spent residue, dichloromethane (30 ml) is added to the vial to extract the solid acid by simple filtration through Celite. The solvent is evaporated under vacuum using a rotary evaporator. The product obtained was washed with ether to remove excess gem diacetate. After purification by distillation (Kugelhor), the solid obtained was identified by appropriate spectroscopic methods.

1-Condensation of 1,1-diacetoxy-1-(3,4-methylenedioxyphenyl)methane [11] with methylene acid compound using microwave heating (KSF):

2-(Benzo-1, 3-dioxol-5-yl)methylene)-2H-inden-1, 3-dione: (1a)

Prepared from diacetoxy-1-(3, 4-methylenedioxyphenyl)methane (5 mmol: 1. 26 g) and 1, 3-indandione (5 mmol: 0. 73 g) in presence of KSF (5 g); Microwaves (P= 420 W, t = 08 min); Yellow Solid crystallised in ethanol; m. p = 203 °C; C₁₇H₁₂O₅; MM = 278. 26 g. mol⁻¹; Yield : 56 %; IR (KBr) cm⁻¹: 2982 (γ C-H), 1682 (γ C=O), 1590 (γ C=C); ¹H NMR (CDCl₃) δ: 6. 19 (s, 2H, OCH₂O); 6. 95 (d, 1H, Hα); 7. 11 (m, 1H Hα); 7. 62 (m, 1H Hα); 7. 85 (m, 4H, H2,3,4,5 ar); 7. 99 (m, 2H, H2-ar); 8. 52 (s, 1H, CH); MS, m/z (%): 278 (M⁺ 100); 279 (19. 07); 280 (2. 8).

5-(Benzo-1, 3-dioxol-5-yl)methylene)-2, 2-dimethyl-1, 3-dioxane-4, 6-dione: (1c)

Prepared from diacetoxy-1-(3, 4-methylenedioxyphenyl)methane (5 mmol: 1. 26 g) and α-Tetralone, (5 mmol: 0. 73 g) in presence of KSF (5 g); Microwaves (P= 520 W, t = 02 min); Yellow Solid crystallised in ethanol; m. p = 75 °C; C₁₈H₁₆O₅; MM = 278. 30 g/mol; Yield : 51 %; IR (KBr) cm⁻¹ : 3010 (γ C-H), 2830 (γ CH₃), 1680 (γ C=O), 1660 (γ C=C), 1230 (γ C-O-C); ¹H NMR (CDCl₃) δ: 2. 19 (m, 4H, CH₂); 7. 36  (m, 2H Hα); 7. 62 (m, 1H Hα); 7. 85 (m, 4H, H2,3,4,5 ar); 7. 99 (m, 2H, H2-ar); 8. 52 (s, 1H, CH); MS, m/z (%): 276 (M⁺ 100); 277 (15. 7); 278 (2. 7).

2-(Benzo-1, 3-dioxol-5-yl)methylene)-3, 4-dihydroraphalen-1(2H)-one: (1e)

Prepared from diacetoxy-1-(3, 4-methylenedioxyphenyl)methane (5 mmol: 1. 26 g) and Tetronic acid [2, 4-(3H, 5H)furandione] (5 mmol, 0. 5 g) in presence of KSF (5 g); Microwaves (P= 420 W, t = 03 min); Red Solid crystallised in ethanol; m. p = 203°C; C₁₇H₁₂O₅; MM = 232. 18 g. mol⁻¹; Yield : 61 %; UV-Visible λ max log (ε) (EtOH) nm: 402 (3. 99); 282 (3. 75); 252 (3. 70); IR (KBr) cm⁻¹ : 3010 (γ C-H),
1751 (γ C=O), 1690 (γ C=O), 1602 (γ C=C); 1H NMR (CDCl₃) δ: 4. 65 (s, 2H, CH₂); 6. 20 (s, 2H, OCH₂O); 7. 13 (d, 1H, H₂ ar); 7. 8 (t, 1H, H₂ ar); 8. 03 (s, 1H, CH=O) & 8. 52 (m, 1H, H₂, MS, m/z (%): 232 (M+, 100); 233 (18. 7); 234 (2. 4).

2-Condensation of Bis(diacectoxy) methyl thiophene [2] with active methylene compound (K10/ZnCl₂)

5-(2-thienylmethylene)-2-thioxo-4-thia-zolidinone: (2a)
Prepared from bis(diacectoxy) methyl thiophene (5 mmol: 1. 07 g) and Rhodanine [2-Thioketo-4-thia-zolidinone: (2b)] (15 mmol, 1.07 g) in presence of K10/ZnCl₂ (5 g); Microwaves (P = 490 W, t = 4 min); Orange Solid crystallised in ethanol; m. p = 172 °C; C₄H₄NO₃S; MM = 163. 2 g. mol⁻¹; Yield : 79 %; UV-Visible λ max log (ε) (EtOH) nm: 257 (3. 75), 291 (4. 16), 401 (4. 64); IR (KBr) cm⁻¹: 1698 (γ C=O), 1615 (γ C=C). NMR (CDCl₃) δ: 7. 15 (m, 1H, H α ar); 7. 35 (d, 1H, H arom); 7. 66 (d, 1H, H arom); 7. 87 (s, 1H, CH=CH₂); 11. 50 (s, 1H, NH).

5-(2-thienylmethylene)-3-methyl-2-thiopropio-4-thia-zolidinone: (2c)
Prepared from bis(diacectoxy)methylthio-phen (5 mmol: 1.07 g) and 3-methylrhodanone (5 mmol, 0.92 g) in presence of K10/ZnCl₂ (5 g); Orange solid crystallised in ethanol; Microwave (P = 490 W, t = 5 min); m.p = 171 (lit[12]:170); C₄H₄NO₃S; MM = 241. 35 ; Yield : 84 %; UV-Visible λ max log (ε) (EtOH) nm: 254 (3. 72), 288 (4. 10), 395 (4. 60); IR (KBr) cm⁻¹: 1700 (ν C=O), 1620 (ν C=O); 1H NMR (250 MHz,CDCl₃). δ: 3. 45 (s, 3H, CH₃-N), 7. 10 (m, IH, H arom), 7. 30 (d, IH, H arom), 7. 60 (d, IH, H arom), 7. 80 (s, 1H, CH=CH₂).

5-(2-thienylmethylene)-2,4,6-(1H,3H,5H) pyrimidinetrione: (2b)
Prepared from bis(diacectoxy) methyl thiophene (15 mmol: 3. 21 g) and barbituric acid [2,4,6(1H,3H,5H)-Pyrimidinetrione: (1)] (15 mmol, 1.92 g) in presence of K10/ZnCl₂ (5 g); Microwave (P= 490 W, t = 4 min); Red Solid crystallised in ethanol; m. p = 272; C₂H₆N₂O₂S; MM = 222. 22 g/mol; Yield : 81 %; UV-Visible λ max log (ε) (EtOH) nm: 254 (3.84), 259 (3. 79); 379 (3.98); IR (KBr) cm⁻¹: 3525-3575 (γ NH), 1752 (γ C=O). 1H NMR (CDCl₃). δ: 7. 53 (m, 1H, H ar); 8. 40 (m, 2H, H ar); 8. 55 (s, 1H, CH₂); 11. 32 (s, 1H, NH).

Cleavage of 5-arylidene rhodanine with Potassium Fluoride–Barium Oxide (BaO-KF)

General procedure: potassium fluoride–barium oxide (BaO-KF) (3g) is added to a solution of 5-arylidene rhodanine (5 mmol) in methylene chloride. After evaporation of the solvent under vacuum, the solid is irradiated with microwaves (490 W, 4-5 min). Water (15 ml) was added and filtered. The filtrate was acidified to pH = 2 with hydrochloric acid and the β-thienyl-α-thiacylacidic acid was isolated by filtration. The acid is crystallized in ethanol.

β-thienyl-α-thiacylacidic acid:
Yellow solid crystallized in ethanol; Microwave (P= 280 W, t = 4 min); m.p =116°C; C₂H₂O₂S; MM = 155.19 g/mol; Yield : 93%; UV-Visible λ max log (ε) (EtOH) nm: 232 (3.65), 251 (3.53). 261 (3.52). 268 (3.52). 337 (4.09); IR (KBr) cm⁻¹: 2580, 2638 (ν SH),1672 (ν C=O ),1595 (ν C=O); 1H NMR (250 MHz,CDCl₃): 4.64 (s, IH, SH), 7.00-7.59 (m, 3H, H arom) , 8.11 (s, IH, CH₂) 8.72 (m, IH, CO₂H)

III. Results and discussion

In our work, we mainly used the KSF with high acidity of Brønsted. Starting from the idea that the hydrolysis of esters during esterification reactions catalyzed by KSF clay under microwave irradiation has already been done by the authors, we hypothesized that water molecules intercalated in the Montmorillonite KSF, highly polar and strongly activated by microwave, were responsible for the hydrolysis reaction in situ of diacettes.

We have prepared arylidene compounds from 1,1-diacetate piperonyl methane (1), by reaction “one-pot” with compounds have an acidic methylene, under microwave irradiation.(Scheme-1)

Gem diacetate is impregnated on Montmorillonite KSF by dissolution in methanol, followed by evaporation of the solvent in vacuo. A trace of water added to the solid mixture before irradiation. The reaction is rapid and reproducible. After three minutes of irradiation at 420 W in a simple microwave trading, the yield is 61%. The procedure is greatly simplified compared to heating at reflux with the use of sulfuric acid.

The reaction produces two molecules of acetic acid. Montmorillonite KSF is a Bronsted acid catalyst in condensation reactions with aldehydes.

The results of the condensation are reported in Table 1.

Faced with average yields ranging from 50% to 61% with clay protonated (Mont-H⁺), we thought of using a Lewis acid catalyst. Substituting the proton by the zinc cations in the K10, then obtained a Lewis acid catalyst (K10-ZnCl₂) non hydrolysable, unlike the ZnCl₂ alone is very sensitive to water. These can form the pillars between the layers it is adapted better to catalyze the formation of the corresponding aryldienes from bis (diacetoxy) methylthiophene (2).

The literature review of furfuryldienes derivatives and thiencyldienes showed a less experienced. Their synthesis from the corresponding carbonyl compounds in acidic homogeneous medium is poorly reproducible. Our work was to find a replacement base for access to aryldienes compounds in the Knoevenagel reaction with active methylene compounds. The use of this new supported catalyst has allowed condensing in dry conditions under microwave activation a variety of active methylene compounds (Scheme.2)

According to the results, we found that the doped solid acid catalysis better by zinc cations and under the same conditions catalyzing arylidines with significant yield increases ranging from 75 % to 79 %.

Cleavage of 5-arylidene rhodanine compound with Potassium Fluoride–Barium Oxide (BaO-KF).
Cleavage of arylidene rhodanine derivative in position 5 in basic medium on potassium fluoride–barium oxide (BaO-KF) under microwave irradiation and free solvent is a simple and effective method for synthesis of, \( \beta \)-aryl-\( \alpha \)-thiolacrylic acids.

We were inspired by the literature that the cleavage takes place with heated alkali hydroxide, barium hydroxide at 100°C [10]. After acidification derivative \( \beta \)-aryl-\( \alpha \)-thiolacrylic acids were obtained.
We report herein the cleavage of 5-arylidene-2-thioxo-4-thiazolidinones by potassium fluoride–barium oxide (BaO-KF). By activation under microwave irradiation (490 W, 4-5 min)(Scheme-3). Extraction with water and acidification gave β-thienyl-α-thiolacrylic acid with yield (93%). The β-thienyl-α-thiolacrylic acid can exist in two tautomeric forms: β-thienyl-

α-thiolacrylic acids [form (A)] or as β-thienyl-α-thiopyruvic acids [form (B)]. Spectroscopic data and chemical properties are in favour of the predominance of form (A): In the 1H NMR spectrum no signal for the benzyl group appears and the resonance at 4. 64 ppm was attributed to the SH

Scheme 3: Cleavage of 5-arylidene rhodanine derived with potassium fluoride–barium oxide (BaO-KF)

IV. Conclusion

A general method was designed for the one pot synthesis of arylidenes compounds from gem diacetates whit acidic methylene a study on Knoevenagel reaction under acid heterogeneous conditions without solvent and under microwave irradiation. This method, using montmorillonite KSF (Brönsted acid) and doped montmorillonite by Zinc (Lewis acid) is very efficient and much more rapid than classical methods. Compounds with potential synthetic and biological interest are synthesized.

These compounds can be cleaved with potassium fluoride–barium oxide (BaO-KF) into β-thienyl-α-thiolacrylic acids in quasiquantitative yields, which is a reaction intermediate for the synthesis of many reaction compounds (amino acid, nitriles acid, and amines)
